

## An Interactive Introduction to Complex Numbers

### 3. Exponentiations

#### Example 3.1:

Open the [Applet Exponentiations](#) and set  $z = \sqrt{2} \cdot e^{22.5^\circ \cdot i}$  in exponential form. Then click on  $z^n$  and set  $n = 2$ . Look at the result in exponential form. Note that  $|z^2| = |z|^2 = r^2$  and  $\arg(z^2) = 2 \cdot \varphi$ .

Indeed, we calculate  $z^2 = (\sqrt{2} \cdot e^{22.5^\circ \cdot i})^2 = (\sqrt{2})^2 \cdot (e^{22.5^\circ \cdot i})^2 = 2 \cdot e^{22.5^\circ \cdot i \cdot 2} = 2 \cdot e^{45^\circ \cdot i}$ .

Shift  $n$  to  $n = 4$ , which leads to  $z^4 = (\sqrt{2})^4 \cdot (e^{22.5^\circ \cdot i})^4 = 4 \cdot e^{22.5^\circ \cdot i \cdot 4} = 4 \cdot e^{90^\circ \cdot i}$ .

#### Rule 3.1

The  $n$ -th exponentiation of  $z = r \cdot e^{\varphi \cdot i}$  in exponential form is  $z^n = (r \cdot e^{\varphi \cdot i})^n = r^n \cdot (e^{\varphi \cdot i})^n = r^n \cdot e^{n \cdot \varphi \cdot i}$   $n \in \mathbb{R}$  with  $|z^n| = |z|^n = r^n$  and  $\arg(z^n) = n \cdot \varphi$ .

There exists no general rule for the exponentiation of  $z = a + b \cdot i$  in cartesian form. If  $n \in \mathbb{N}$ , we could use the general binomial theorem. However, in most cases it is easier to transform  $z = a + b \cdot i$  into exponential form and apply rule 3.1.

In case of  $n = 2$  the first binomial equation tells us that  $z^2 = (a + b \cdot i)^2 = a^2 + 2 \cdot a \cdot b \cdot i + (b \cdot i)^2 = a^2 - b^2 + 2 \cdot a \cdot b \cdot i$ .

Recall, we defined the exponent as  $n \in \mathbb{R}$ , i. e. negative values of  $n$  are feasible as well.

#### Example 3.2:

Open the [Applet Exponentiations](#) and set  $z = \sqrt{2} \cdot e^{22.5^\circ \cdot i}$  in exponential form. Then click on  $z^n$  and set  $n = -2$ . Of course, we get  $z^{-2} = (\sqrt{2} \cdot e^{22.5^\circ \cdot i})^{-2} = (\sqrt{2})^{-2} \cdot (e^{22.5^\circ \cdot i})^{-2} = 0.5 \cdot e^{22.5^\circ \cdot i \cdot (-2)} = 0.5 \cdot e^{-45^\circ \cdot i} = 0.5 \cdot e^{315^\circ \cdot i}$ .

The result can also be derived by calculating  $z^{-2} = \frac{1}{z^2}$  just as with real numbers.

Regarding example 3.1 we calculate  $z^{-2} = \frac{1}{z^2} = \frac{1}{2 \cdot e^{45^\circ \cdot i}} = \frac{1 \cdot e^{0^\circ \cdot i}}{2 \cdot e^{45^\circ \cdot i}} = 0.5 \cdot e^{-45^\circ \cdot i} = 0.5 \cdot e^{315^\circ \cdot i}$ .

**Rule 3.2**

$$z^{-n} = \frac{1}{z^n} \quad n \in \mathbb{R}, \operatorname{Re}(z) \neq 0 \vee \operatorname{Im}(z) \neq 0, |z| \neq 0$$

**Roots**

The natural question to ask now is, whether  $z = r \cdot e^{\varphi \cdot i}$  has also roots  $w = \sqrt[k]{z}$  i.e. are there any complex numbers  $w$  solving for  $w^k = z \quad k \in \mathbb{N}$ ?

**Example 3.3 a**

From example 3.1 we can conclude that  $w = \sqrt{2} \cdot e^{22.5^\circ \cdot i} = 1.4142 \cdot e^{22.5^\circ \cdot i}$  is a square root of  $z = 2 \cdot e^{45^\circ \cdot i}$  or, alternatively, a solution of  $w^2 = 2 \cdot e^{45^\circ \cdot i}$ . But is it the only one? To check this out, open the [Applet Exponentiations](#) and set  $z = 2 \cdot e^{45^\circ \cdot i}$  in exponential form. Then click on  $w^k = z$  and set  $k = 2$ . We see that  $w^2 = 2 \cdot e^{45^\circ \cdot i}$  has two solutions:  $w_1 = 1.4142 \cdot e^{22.5^\circ \cdot i}$  and  $w_2 = 1.4142 \cdot e^{202.5^\circ \cdot i}$ .

What is the intuition behind the second solution  $w_2$ ? Recall that  $z = 2 \cdot e^{45^\circ \cdot i}$  corresponds to  $z = 2 \cdot e^{405^\circ \cdot i}$ . Then  $w_2 = (2 \cdot e^{405^\circ \cdot i})^{0.5} = \sqrt{2} \cdot e^{405^\circ \cdot i \cdot 0.5} = 1.4142 \cdot e^{202.5^\circ \cdot i}$ .

$z = 2 \cdot e^{45^\circ \cdot i}$  also corresponds to  $z = 2 \cdot e^{765^\circ \cdot i}$ ,  $z = 2 \cdot e^{1125^\circ \cdot i}$  and so on. But why do further solutions not exist? We see that  $w = (2 \cdot e^{765^\circ \cdot i})^{0.5} = 1.4142 \cdot e^{382.5^\circ \cdot i}$ , which corresponds to  $w_1 = 1.4142 \cdot e^{22.5^\circ \cdot i}$ , whereas  $w = (2 \cdot e^{1125^\circ \cdot i})^{0.5} = 1.4142 \cdot e^{562.5^\circ \cdot i}$  corresponds to  $w_2 = 1.4142 \cdot e^{202.5^\circ \cdot i}$ .

**Example 3.3 b:**

Open the [Applet Exponentiations](#) and set  $z = 2 \cdot e^{45^\circ \cdot i}$  in exponential form. Then click on  $w^k = z$  and set  $k = 3$  and  $k = 4$ .

Jens Siebel: An Interactive Introduction to Complex Numbers  
3. Exponentiations

For  $k=3$  we get  $w_1 = 1.2599 \cdot e^{15^\circ \cdot i}$ ,  $w_2 = 1.2599 \cdot e^{135^\circ \cdot i}$  and  $w_3 = 1.2599 \cdot e^{255^\circ \cdot i}$ .

For  $k=4$  we get  $w_1 = 1.1892 \cdot e^{11.25^\circ \cdot i}$ ,  $w_2 = 1.1892 \cdot e^{101.25^\circ \cdot i}$ ,  $w_3 = 1.1892 \cdot e^{191.25^\circ \cdot i}$  and  $w_4 = 1.1892 \cdot e^{281.25^\circ \cdot i}$ .

**Rule 3.3 a**

$w^k = z = r \cdot e^{\varphi \cdot i}$  has  $k \in \mathbb{N}$  solutions. The angle between succeeding solutions is  $\frac{360^\circ}{k}$  (degree) or  $\frac{2 \cdot \pi}{k}$  (radian).

**Rule 3.3 b**

The first solution of  $w^k = z = r \cdot e^{\varphi \cdot i}$  is  $w_1 = \sqrt[k]{r} \cdot e^{\frac{\varphi}{k} \cdot i}$ .

**Rule 3.3 c**

In degree the  $j$ -th solution of  $w^k = z = r \cdot e^{\varphi \cdot i}$  is  $w_j = \sqrt[k]{r} \cdot e^{\frac{\varphi + (j-1) \cdot 360^\circ}{k} \cdot i}$  with  $|w_j| = \sqrt[k]{r}$  and  $\varphi_{w_j} = \arg w_j = \frac{\varphi + (j-1) \cdot 360^\circ}{k}$ .

In radian the  $j$ -th solution of  $w^k = z = r \cdot e^{\varphi \cdot i}$  is  $w_j = \sqrt[k]{r} \cdot e^{\frac{\varphi + (j-1) \cdot 2 \cdot \pi}{k} \cdot i}$  with  $|w_j| = \sqrt[k]{r}$  and  $\varphi_{w_j} = \arg w_j = \frac{\varphi + (j-1) \cdot 2 \cdot \pi}{k}$ .

There is no general rule for roots of complex numbers in cartesian form.

**Exercise 3.1:**

We have  $z = 1.5 \cdot e^{117^\circ \cdot i}$  and  $z = 5 - 2 \cdot i$ . Determine  $z^2$ ,  $z^{-3}$  and  $z^{0.6}$  for both numbers. Use the [Applet Exponentiations](#) to check your answers.

**Exercise 3.2:**

Turn  $z = 5 \cdot i$  into exponential form. Then determine all solutions of  $w^5 = z$  and rewrite them in cartesian form. Use the [Applet Exponentiations](#) to check your answers.
